We have developed an ultrafast SIR method for multipinhole SPECT programmed in CUDA and tested using a high performance graphic processing unit. We show significant performance improvement in reconstruction using both computer-generated and experimental sinograms, demonstrating an up-to fifty-fold speed enhancement with virtually the same accuracy as the CPU-based SIR (with 0.15% normalized root mean square error).

## Motivation

## Why use GPUs for statistic iterative reconstructions (SIRs)? [1]

### What's new here?

- · GPU-based SIR for multipinhole SPECT
- using pre-computed system matrix Implemented using CUDA / CUSPARSE [3]
- GPU computing API
- · Models finite pinhole aperture

### **CPU vs. GPU Implementations**

Why multipinhole SPECT?

in dynamic studies and reduce motion artifacts [2]

single pinhole or parallel hole SPECT

High resolution with increased sensitivity compared to

Simultaneously acquired multiple views enhance accuracy
